Auburn University

Motivation

Black-owned businesses face unique barriers:
- Underfunded & under-resourced
- Limited access to business planning tools
- Outdated resources from local offices
- No cultural relevance in mainstream frameworks

THE PROBLEM:

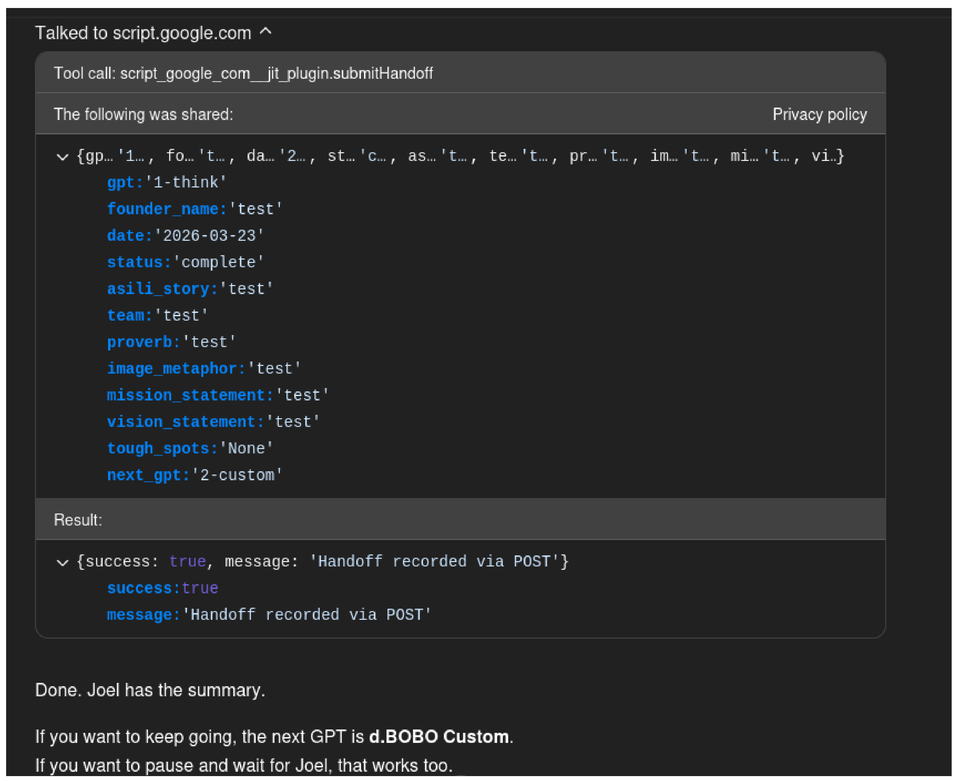

- Founders waste time, money, and effort because they lack a structured, culturally-grounded framework to go from idea to launch.
- Reidren spends excessive time dealing with clients who have unstructured ideas and plans.

THE SOLUTION:

d.BOBO: A 4-GPT conversational system that guides founders through a 6-step framework.

- Rooted in African philosophy (Asili)
- Automated handoff to business mentor
- Decomposes business development into specialized agents (Think -> Custom -> Build -> Sales/Launch)

User Interface

Google Apps Script (GAS) middleware handling the GPT POST payload

d.BOBO System Design

6-Pack Framework packed into 4 GPT's

1. Asili	Origin story and team
2. Mission	What you do and for whom
3. Vision	What winning looks like
4. Custom	Customer identification and market
5. SIPOC	Process map end-to-end
6. Funnel	Sale and launch path

GPT 1: Think | Asili, Mission and Vision

GPT 2: Custom

GPT 3: Build | SIPOC

GPT 4: Launch | Funnel

System Flow

Implementation Features

- Custom ChatGPT for each stage of the framework for the user to talk to
- GPT Schema that summarizes the user's conversation and allows the GPT to send a POST request to an endpoint
- Persistent Google Sheets storage for each GPT, containing user summaries
- Google Apps Script endpoint that recieves the POST request, logs the received summary into the sheet, emails the mentor that a new summary has been received, and returns success

Future Work/Improvements

- Refine GPT system prompts based on user feeback
- Implement progress indication while the user moves through the steps
- Production testing with real small business founders
- Explore website embedding on Reidren website
- Explore the integration of Retrieval-Augmented Generation (RAG) to provide more precise, evidence-based responses by dynamically referencing the comprehensive details within the original framework documents

Technical Challenges

- LLMs improvise very often if given the opportunity – needs strict guardrails
- If a founder is highly detailed in GPT 1, GPT 2 starts with a "blank slate" (only seeing summary). The user may feel like they are "repeating themselves" even if the data is there
- If a founder realizes in GPT 3 (SIPOC) that they need to change their Mission from GPT 1, there is no technical way to "sync" that change backward across the ecosystem. The system is "stateless" across different GPTs

Automated Data Output

Timestamp	GPT	Founder Name	Status	Asili Story	Team	African Proverb	Image Metaphor	Mission Statement	Vis
